

Team reflection week 3

Customer Value

We finished one user story and quite a lot of tasks. This has brought value. For instance a finished start screen, some backend programming off notifications, weather-api and settings.

Scope

Good amount of work for the first week. Although we delivered a lot of value we did not finish the user story 2.4 "As a user I want to be able to see the current weather", however we have implemented everything needed to make this story easy to implement in the next sprint. So we overestimated a bit how much we could deliver. This is due to the fact that we had a hard time estimating the time it would take to learn to work with android studio. The platform and github struggled a bit. However, since we had chosen very simple user stories we managed to finish almost everything anyway.

We want our future user stories to have a reasonable size, which we appear to be close to achieving. In order to get there we need to develop a bit more and improve our estimations.

Stakeholder: Had an opinion that the weather forecast that base the scheduling proposal should be based on a fixed point. So that you don't get a falsely proposal based on your current location, if your traveling or working far from home eg. We thought this was a good idea to implement.

Social contract

We're happy with the contract as it currently is and also the follow through on the contract. We believe we have spent a healthy amount of time this week to keep up with our work.

Design decisions and product structure

Design decisions are made based on what tutorials/examples are available. This lowers development time significantly, compared to researching APIs and weighing pros and cons. For now this seems to be the best choice available, since we would otherwise need a lot of these weeks for just looking up APIs.

Application of Scrum

The scrum master has successfully managed to communicate and help the team with technological tools. By dividing up the project into small tasks we have been able to work separately in the start, However we haven't merged our projects yet which may take some time. We talked to the PO, Ludvig, and came to the conclusion that some of our user stories were a little bit too large so we scaled some of them down. Otherwise the PO was satisfied with this sprint.

Todo:

How will we save future settings eg.?

How will the app work on different androids?

How will the app work on different sized screens?
